LEMAUSO

Legal management and automation software designed specifically for law firms, legal practices, and procurator corporations in Spain to start with and then maybe internationally.

Spanish law firms and procurador corporations lose time managing judicial files, court notifications, repetitive documents, and billing in separate systems. We propose a Spain-specific (to begin with) legal operations platform that centralizes judicial and extrajudicial matters, turns notifications into controlled deadlines, automates routine documents, and connects work to billing. The focus will be on matter management, notification control, document automation, and invoicing, with GDPR-grade security and workflows compatible with LexNET-based practice. Once the system works, we shall try and create the same models for other countries.

Features required: Allowing the comprehensive management of judicial and extrajudicial case files, document automation, notification control, and billing

Spain-specific practice operations platform that unifies judicial and extrajudicial matters, LexNET-aware notification control, document automation, and compliant billing.

Spain's courts already require legal professionals to use electronic filing and communication systems, with LexNET as the secure platform for pleadings, copies, and notifications, so integration or workflow compatibility is a central selling point

1. **PROBLEM ANALYSED IN THE MARKET:**

Law firms and procurator corporations manage judicial files, extrajudicial matters, clients, documents, deadlines, notifications, time, and invoices across disconnected tools.

- Court notifications and procedural deadlines create high operational risk if missed.
- Document production is repetitive, while billing and matter profitability are often difficult to track.
- Existing tools may handle parts of this, but few are designed around Spanish judicial workflows, procuradores, colegios, and LexNET-based notification practices.

2. OBJECTIVE:

Fewer missed deadlines, faster document drafting, complete matter visibility, controlled notifications, and accurate billing

3. WORKFLOW CHART

Area	What the system should do
Client intake	Capture enquiry, conflict check, engagement letter, responsible lawyer, matter type
Judicial matters	Track court, jurisdiction, procedure, parties, procedural stage, hearings, filings, deadlines
Extrajudicial matters	Manage claims, negotiations, contracts, corporate matters, out-of-court settlements
Notifications	Log LexNET notifications, assign ownership, calculate response deadlines, escalate overdue items, link email directly to the platform
Documents	Generate pleadings, powers of attorney, engagement letters, invoices, and standard letters from templates
Billing	Track time, fixed fees, expenses, provisions de fondos, invoices, collections, and profitability
Reporting	Show workload, deadlines, matter status, recovery rates, and revenue by lawyer or client

4. VISION

First version:

- Matter and client management.
- Judicial and extrajudicial file records.
- Task, hearing, and deadline calendar.
- Notification intake and deadline alerts.
- Document templates and automated document generation.
- Time recording and basic invoicing.
- Role-based access, audit trail, and secure document storage.

Advanced features for later phases: AI drafting, client portal, e-signature, accounting integrations, court-system integrations, analytics, and multi-entity management.

5. GDPR SECURITY AND COMPLIANCE

Data protection laws under the European Guidelines and Spanish Laws are very strict and require all software companies operating in Spain to comply with them. Security of the data will be key to making this project come alive.

Include a compliance section in the proposal:

- GDPR compliance, data minimization, retention policies, access logs, encryption in transit and at rest, and breach-response procedures.
- Professional secrecy and strict role-based permissions.
- Conflict-of-interest checks across clients, former clients, and opposing parties.
- Spanish invoicing requirements, EUR currency, VAT/IRPF considerations, and integration potential with Spanish accounting tools.
- Data residency, hosting, backup, disaster recovery, and security-questionnaire readiness.

GDPR breach documentation and notification duties are particularly relevant because legal files contain highly sensitive personal data. Spanish legal-practice requirements also make conflict checks and a record of client communications important workflow controls. The sanctions are of up to 600.000,00 euros for every breach.
